Date: 17 January 2019 at 3:04:08 PM AEDT
To: "xxxxxxxx@xxxxxxxx.xxx" <catmjones>

Dear Cat

I am following up on enquiries that were hidden due to a glitch in our database.

Your enquiry was discussed amongst the entomology staff and they were unable to provide any comments.

They did mention that "Orthopterans commonly regurgitate liquids when they're disturbed, but I haven't heard of them doing it just to drink it slower later"

The Katydid could have been "playing" with its food was another thought as practice for knowing how to perform the above mentioned behaviour.

Please contact us for any further assistance.

Kind regards

Melissa Murray

Information officer
